Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.
VITALITY IN FERNS.—*Polypodium incanum* has been called the "Resurrection Fern" on account of its wonderful vitality, but our common *P. vulgare* appears to be no less tenacious of life. In November, 1876, as an experiment, I threw a plant of this latter species under a bench where it remained in a perfectly dry state, and subject to the warm atmosphere of a heated room, until late in April, 1877—a period of more than five months. It had become so dry and shriveled that it did not seem possible for any life to exist, yet under the influence of frequent rains it soon began to start and is now growing moderately.

Just how long life may be retained under such conditions as those to which this plant was subjected would seem to me to be an interesting subject for inquiry, and one that might lead to useful results in the transportation of certain plants.

It may not be out of place in this connection to state that last spring I took from some pressed herbarium specimens of *Trichomanes Petersii* sent to me a short time previously by Mr. Peters—I do not know how long they had been collected, but presume for a short time only—a plant and placed it under a bell glass. In a very few days it began to straighten up its tiny fronds and is now living and growing.—Geo. E. Davenport, Boston, Aug. 3, 1877.

ADIANUM CAPILLUS-VENERIS.—In a private letter Mr. Davenport makes the following statement in reference to this plant: "It might be an interesting fact to state that I have succeeded in cultivating this species from Utah in the open garden and carried my plant safely through the long severe winter of 1876–7 without any other protection than some loose brush thrown over it. The plant was set out in May, 1876, in some rock work by the side of a little brook, and had an open southern exposure. It grew finely all through the year, and proved itself hardly by surviving our last severe winter, and is now a fine, compact, healthy plant."—J. M. C.

NOTES FROM SOUTH WESTERN VIRGINIA.—Mr. Howard Shriver has just visited New River, a most interesting locality, and writes as follows: "I found Cedrela in a new spot at Carter's and Forney's (Allisonia C. H.). I also found at Carter's abundance of *Pyrularia oleifera*, but the blooms had nearly all fallen, leaving only one plant, with one pear in an unripe state. The plants seemed flourishing enough, so that I was at a loss to determine whether the failure to fruit resulted from the excessive drought, or from late frosts, which cut garden plants badly as well as some wild ones, or from some other cause. The flowers came several at a time and regularly dropped, until many stems were terminated by a single flower at the time of my arrival.

*Halesia tetraptera* had gone out of bloom, but the trees had made plenty of fruit, which was then about a quarter of its full size. *Chionanthus Virginica* was nearly out of bloom. The shrubs were found in abundance all along the river. *Ptelea trifoliata* lined the river shores for several miles and was in full bloom. So was *Celastrus scandens*. A plant much resembling *Phacelia parviflora* appeared sparingly on the shore. It does not answer satisfactorily to the above name and may be a variety. *Sedum ternatum* abounded, but I saw not a single *S. Nevii*, which abounds at Allisonia along with *S. ternatum*. I found here for the second time *Aspidium Goldianum*, Hook, and *Cystopteris fragilis*, Bernh., also *Asplenium angustifolium*, Mx. While sitting on the bank of New River with Forney, I desired him without moving to pass to me all the ferns he could reach, which were as follows: *Adiantum pedatum*, *Asplenium Trichomanes*, *Asplenium ebenum*, *Aspidium acrostichoides*, var. incisum, *Cystopteris fragilis*, *Onoclea sensibilis*, *Woodia obtusa*, *Osmunda Claytoniana*, and one or two others of which I am not certain, perhaps, *Cystopteris bulbifera*. I also found elsewhere, *Polypodium vulgare*, *Pteris aquilina*, *Pelea atropurpurea*, *Asplenium Ruta-muraria*, *Cunotia rhamnothylax*, *Phleopteris hexagonoptera*, *Aspidium marginale*, *Botrychium Virginicum*,
